Network Master™ Series

Network Master Pro

MT1000A

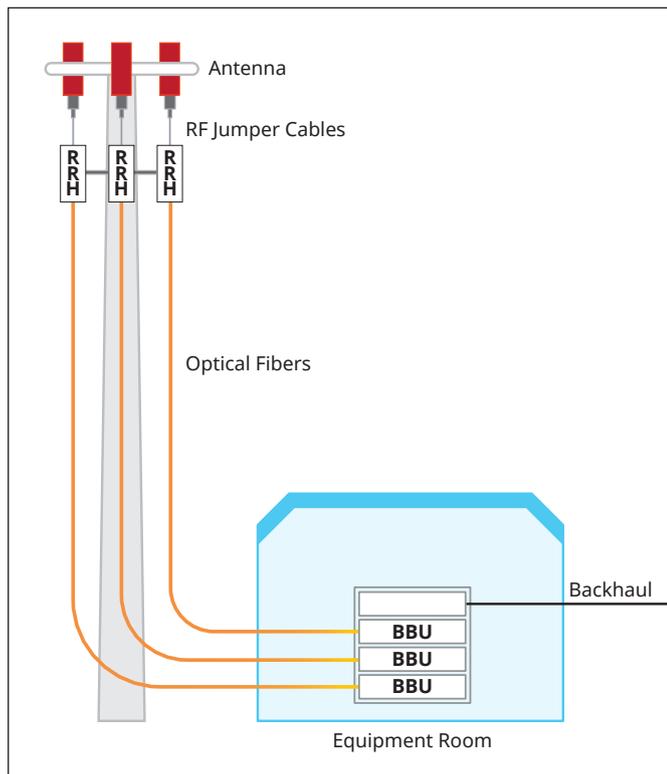

CPRI RF Module

MU100040B

MT1000A Network Master Pro

The migration to CPRI technology in cellular networks

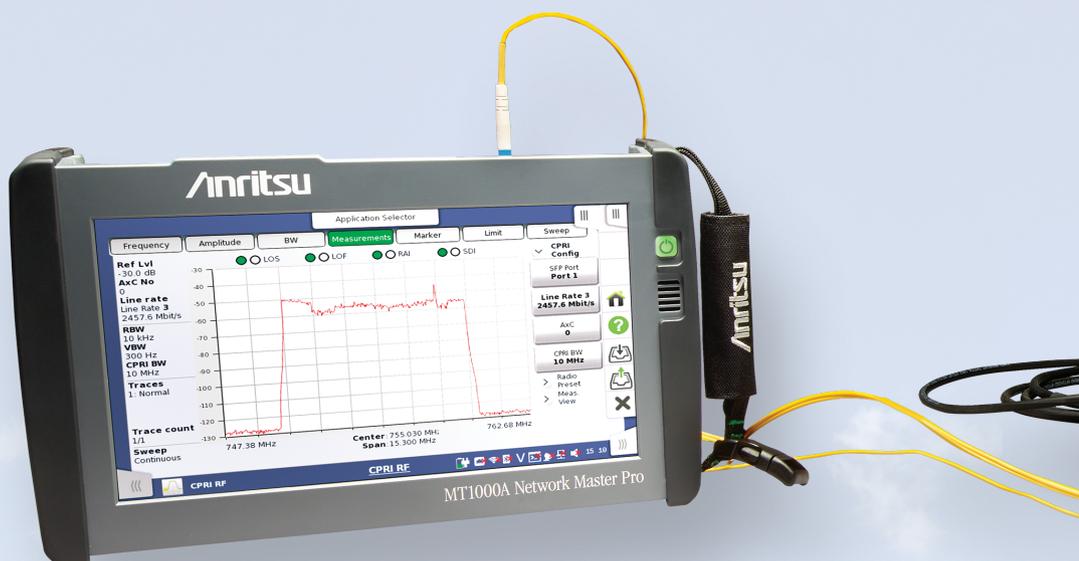

The architecture of cellular networks is evolving rapidly. Demand for greater data throughput from the network and the need to reduce operating costs has led to the implementation of networks that separate the radio from the baseband units.

By moving away from traditional macro cell sites in which ground based radios are connected to tower mounted antennas by long RF cable runs, to using a Remote Radio Head (RRH) at the tower top connected to a BaseBand Unit (BBU) at ground level, the deployment of the cell site can be much more flexible.

BBUs can be located locally at the host cell site or grouped together at BBU hotels up to 25 km from the RRH. This "Hotelling" of BBUs allows radio resources to be allocated dynamically, greatly increasing network efficiency. The interface between the BBU and the RRH is typically a fiber optic cable supporting the Common Public Radio Interface (CPRI) communication standard. The CPRI standard delivers a high speed serial interface with low latency required for LTE network roll out.

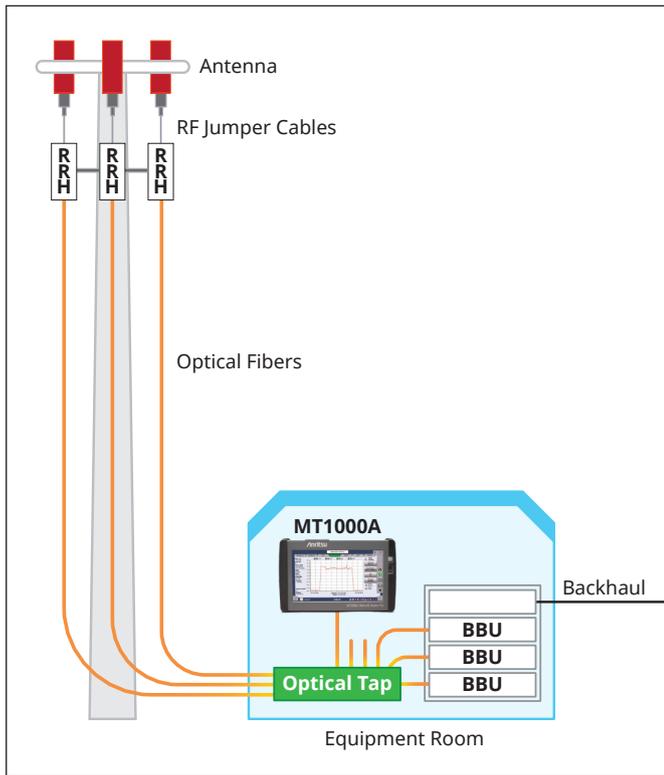

Separating the RRH from the BBU has the benefit of reducing the power consumption in the cell site equipment room and reducing the demands on air conditioning, greatly reducing operational expenditure. It also potentially reduces or even eliminates the need for long RF cable runs that can result in significant radio signal losses.

Testing the CPRI link between the BBU and RRH introduces new challenges for the field technician installing and maintaining the network. As the radio may now be located at the top of a tower, access to RF measurements could require the use of a certified tower climbing crew. However, by tapping into the CPRI link, RF measurements can be made from ground level without the need for any tower climb.

Network Master™ Series MT1000A/MU100040B

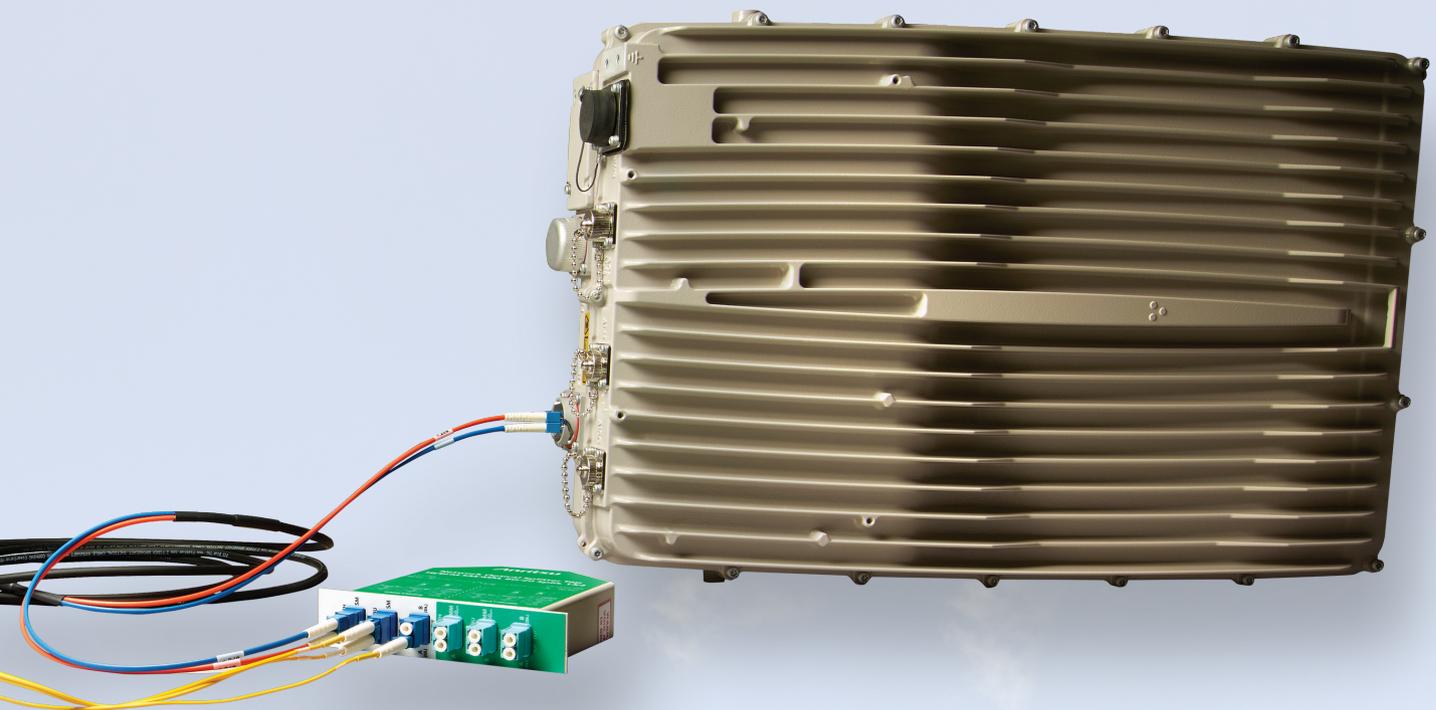

Test challenges for CPRI cell sites implementing CPRI technology

Moving the radio to the tower top and hosting the BBU at the base of the tower or in remote hotels increases network flexibility and performance as well as reducing costs. The increased spectral densification that has been implemented with the roll out of LTE networks as well as overall spectral congestion has made these networks vulnerable to interference and intermodulation. This network degradation may first show up when monitoring KPIs. Especially for dropped calls and reduced data throughput.

MU100040B CPRI RF Module displays the LTE spectrum of the uplink or downlink of Alcatel Lucent/Nokia, Ericsson and Huawei radios.

By monitoring the LTE uplink spectrum on the CPRI uplink, it is possible to monitor for interferers from ground level. The MU100040B CPRI RF Module for the MT1000A Network Master Pro provides the ideal instrument for this application.

Network Master™ Series MT1000A/MU100040B

CPRI RF module for the MT1000A Network Master Pro

Key features

- Displays LTE spectrum of ALU/Nokia, Ericsson and Huawei CPRI radios
- Fast update rate to capture intermittent interferers
- Spectrum pan and zoom for detailed analysis of interferers
- Spectrogram display captures and holds data for intermittent interferers
- 2 SFP slots for simultaneous uplink and downlink testing
- SFP data reading and display
- Layer 2 alarm monitoring and display
- Auto configuration of CPRI parameters
- Base Band Unit Emulation ALU-Nokia LTE (Option 10)
- GPS data reading and display (used with Option 10)
- Modular design for use with MT1000A OTDR and 10G/100G transport test modules
- Battery powered for field use

The MU100040B CPRI RF Module for the MT1000A Network Master Pro adds CPRI RF measurements to Anritsu's transport and fiber test platform. The modular design of MT1000A means that it can be configured just for CPRI measurements or combined with the 10G transport module and OTDR module to create the most comprehensive and versatile fiber and transport tester available.

CPRI RF measurements

The MT1000A Network Master Pro is a hand held battery power tester designed to facilitate the installation and maintenance of cellular networks. CPRI RF measurements are configured and displayed on the 9 inch color touch screen.

Network Master™ Series MT1000A/MU100040B

CPRI RF Module Applications

The MT1000A displays all the applications available from the installed modules. For CPRI RF measurements, select the CPRI RF application icon.

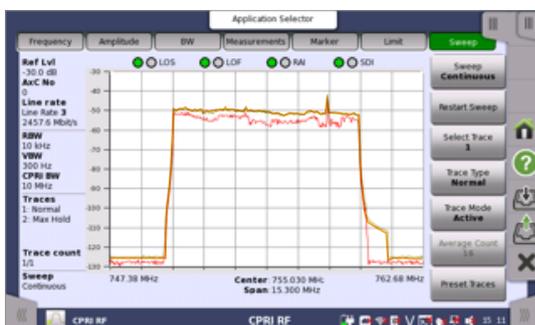

OEM radio presets simplify instrument configuration. By presetting the MT1000A to match the radio under test, key CPRI parameters are automatically configured, reducing chances of incorrect set up giving false results.

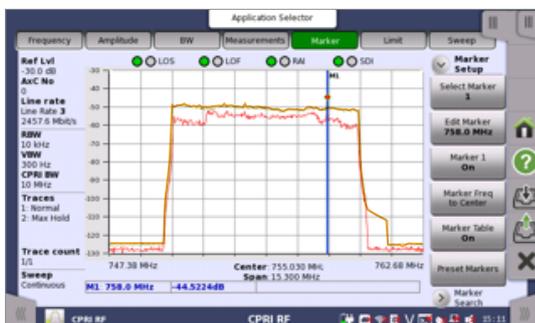

View the live spectrum of an LTE uplink. The fast update rate shows resource blocks being activated dynamically as well as enhancing ability to see intermittent interferers. Layer 2 alarms are displayed by indicator lamps at the top of the screen to confirm the integrity of the signal.

An interfering signal is clearly visible in the LTE spectrum.

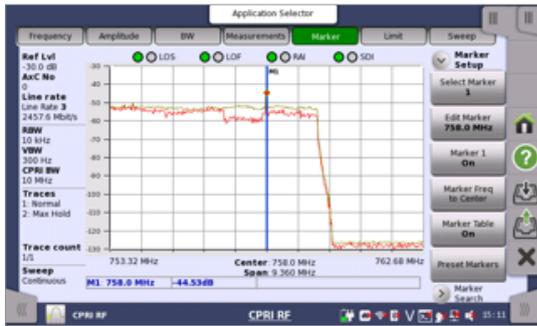

Activating a second trace with Max Hold simplifies identification of intermittent interferers.

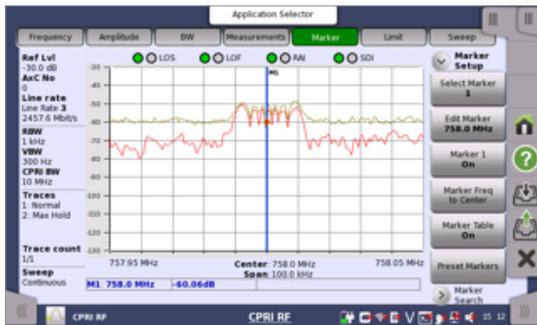

Up to 8 markers can be activated on the trace. Full marker features including Peak Find, Next Peak Left/Right, Marker to Center Frequency and Marker Tables are supported.

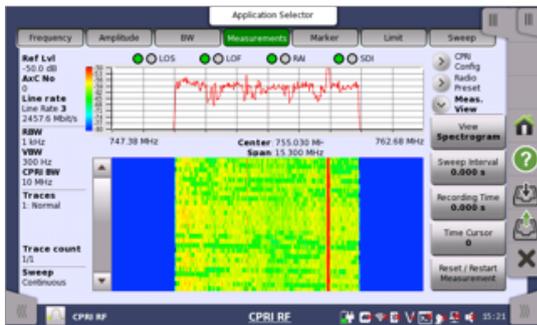

Analyzing the CPRI Uplink

Marker to center frequency positions the interferer to be examined in the center of the display, allowing the user to zoom into the signal for detailed examination.

Reducing the span bandwidth gives a detailed view of the interferer signal spectrum, in this case an FM signal. Knowledge of the nature of the interferer gives invaluable information to enable the source to be located.

A spectrogram feature is ideal for long term monitoring of the spectrum. The spectrogram provides a timed history of all captured spectrums, so intermittent interferers are not lost.

The Layer 2 alarms screen shows full details of both test ports status.

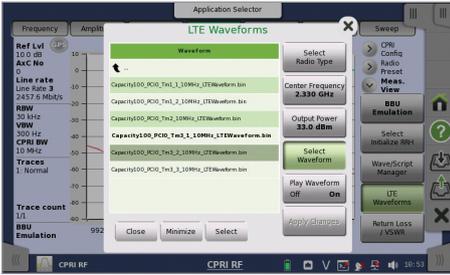

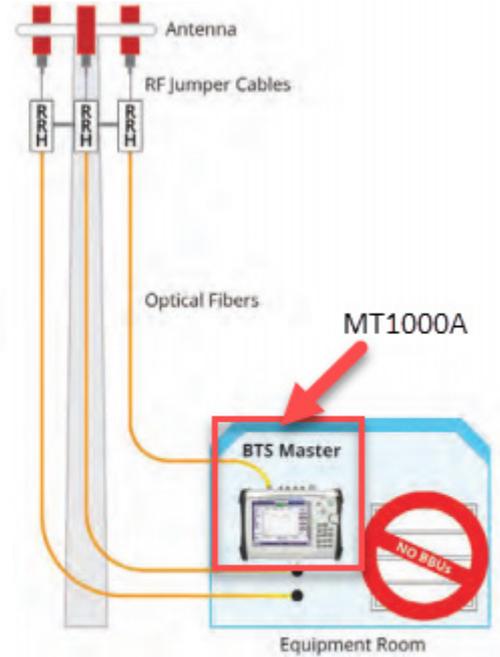

It is essential that the SFP in the tester matches the requirements of the CPRI link under test. Typically the SFP capability data is hard to read from the manufacturer's label. MT1000A conveniently displays the full configuration of each SFP inserted into ports 1 and 2.

BBU Emulation ALU-Nokia LTE Measurements

The BBU Emulation option provides wireless technicians, engineers and contractors the necessary tools to validate that a newly installed ALU/Nokia RRH is installed properly and functional, before the Base Band Unit (BBU) is commissioned on site.

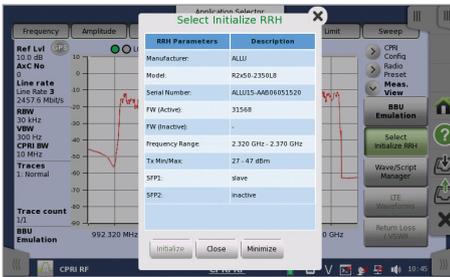

This unique combination of measurement tools will reduce the number of truck rolls a field technicians, contractor or RF engineer will need to make when installing new RRH.

This leads to faster network rollouts and reduced OpEx (Operational Expense) cost when building new sites.

Initialize communications with the RRH. This allows our BBU Emulation option to query and receive the RRH configuration information.

- Manufacturer
- Model Number
- Serial Number
- Firmware
- Frequency Range
- Power
- Location of installed SFP's

SFP Data, shows which type of SFP(s) is installed in the two ports on the RRH.

- Wavelength
- Bit Rate
- Vendor information

Select RRH to test, IP address of the RRH shows up in order of discovery.

Select Radio type to send the correct commands to initiate a LTE waveform transmission.

- Select Radio Type
- Select LTE Waveform
- Select center frequency of Tx
- Select output power
- Load waveform
- Play (Tx) Waveform

Video Inspection Probe G0382A / G0306B

Dirty or damaged optical connectors can greatly affect the performance of the CPRI fiber between the BBU and RRH. Scratches, chips and contamination on optical fiber connector end faces reduce transmission quality and increase errors. This leads to additional I&M work and cost. When the external optical fiberscope (G0382A USB Autofocus type, G0306B USB Standard type: sold separately) is connected, scratches and dirt on the optical connector end face can be confirmed visually. The connector image and detailed PASS/FAIL status is displayed as defined by IEC 61300-3-35 ensuring quality and consistency from connector to connector, technician to technician.
